Summary

10

11

12

19

20

- 1. In the field of phylogenetics, BEAST2 is one of the most widely used software tools. It comes with the graphical user interfaces BEAUti 2, DensiTree and Tracer, to create BEAST2 configuration files and to interpret BEAST2's output files. However, when many different alignments or model setups are required, a workflow of graphical user interfaces is cumbersome.
- 2. Here, we present a free, libre and open-source package, babette:

 'BEAUti 2, BEAST2 and Tracer for R', for the R programming language.

 babette creates BEAST2 input files, runs BEAST2 and parses its results,

 all from an R function call.
- 3. We describe babette's usage and the novel functionality it provides compared to the original tools and we give some examples.
 - 4. As babette is designed to be of high quality and extendable, we conclude by describing the further development of the package.
- Keywords: computational biology, evolution, phylogenetics, BEAST2, R

23 1 Introduction

Phylogenies are commonly used to explore evolutionary hypotheses. Not only 24 can phylogenies show us how species (or other evolutionary units) are related to each other, but we also estimate relevant parameters such as extinction and speciation rates. There are many phylogenetics tools available to obtain an es-27 timate of the phylogenetic tree of a given set of species. BEAST2 (Bouckaert et al. 2014) is one of the most widely used ones. It creates a posterior of jointly estimated phylogenies and model parameters, from one or more DNA, RNA or amino acid alignments (see figure?? for an overview of the workflow). It has a 31 graphical and a command-line interface, that both need a configuration file con-32 taining alignments and model parameters. BEAST2 is bundled with BEAUti 33 2 (Drummond et al. 2012) ('BEAUti' from now on), a desktop application to create a BEAST2 configuration file. BEAUti has a user-friendly graphical user interface, with helpful default settings. As such, BEAUti is an attractive alternative to manual and error-prone editing of BEAST2 configuration files. However, BEAUti cannot be called from a command-line script. This implies that when the user wants to explore the consequences of various settings, this must be done manually. This is the managable workflow when using a few 40 alignments and doing a superficial analysis of sensitivity of the reconstructed tree to model settings. For exploring many trees (for instance from simulations) and for more thorough sensitivity analysis, one would like to loop through multiple (simulated) alignments, nucleotide substitution models, clock models and tree priors. One such tool to replace BEAUti is BEASTmasteR (Matzke 2015), 45 which focuses on morphological traits and tip-dating, but also supports DNA data. BEASTmasteR, however, requires hundreds of lines of R code to setup the BEAST2 model configuration and a Microsoft Excel file to specify alignment files.

BEAST2 is also associated with Tracer (Rambaut & Drummond 2007) and 50 DensiTree (Bouckaert & Heled 2014). Both are desktop applications to analyze the output of BEAST2, each with a user-friendly graphical user inter-52 face. Tracer's purpose is to analyze the parameter estimates generated from a BEAST2 run. It shows, among others, the effective sample size (ESS) and time series ('the trace', hence the name) of each variable in the MCMC run. Both ESS and trace are needed to assess the strength of the inference. DensiTree visualizes the phylogenies of a BEAST2 posterior, with many options to improve the simultaneous display of many phylogenies. However, for exploring the output of many BEAST2 runs, one would like a 59 script to collect all parameters' ESSes, parameter traces and posterior phylogenies. There is no single package that offers a complete solution, but examples 61 of R packages that offer a partial solution are rBEAST (Ratmann 2015) and

nies. There is no single package that offers a complete solution, but examples of R packages that offer a partial solution are rBEAST (Ratmann 2015) and RBeast (Faria & Suchard 2015). RBeast provides some plotting options and parsing of BEAST2 output files, but the plotting functions are too specific for general use, whilst the functions for parsing call those of babette. rBEAST was developed to test a particular biological hypothesis (Ratmann et al. 2016), and hence was not designed for general use.

Here, we present babette: BEAUti 2, BEAST2 and Tracer for R, which

Here, we present babette: BEAUti 2, BEAST2 and Tracer for R, which
creates BEAST2 (v.2.4.7) configuration files, runs BEAST2, and analyzes its
results, all from an R function call. This will save time, tedious mouse clicking
and reduces the chances of errors in such repetitive actions. The interface of
babette mimics the tools it is based on. This familiarity helps both beginner
and experienced BEAST2 users to make the step from those tools to babette.
babette enables the creation of a single-script pipeline from sequence alignments
to posterior analysis in R.

6 2 Description

babette is written in the R programming language (R Core Team 2013) and enables the full BEAST2 workflow from an R function call, in a similar way to what BEAUti, DensiTree and Tracer do. babette's main function is run, which configures BEAST2, runs it and parses its output. run needs at least the name of a FASTA file containing a DNA alignment. The default settings for the other arguments of run are identical to BEAUti's and BEAST2's default settings. Per alignment, a site model, clock model and tree prior can be chosen. Multiple alignments can be used, each with its own (unlinked) site model, clock 84 model and tree prior. 85 babette currently has 108 exported functions to set up a BEAST2 configuration file. babette can currently handle a majority of BEAUti use cases. Because of BEAUti's high number of plugins, babette uses a software architecture that is designed to be extended. Furthermore, babette has 13 exported functions to run and help run BEAST2. One function is used to run BEAST2, others allow the user to check if a BEAST2 configuration file is indeed valid. Finally, babette has 21 exported function to parse the BEAST2 output files and analyze the created posterior. babette gives the same ESSes and summary 93 statistics as Tracer. The data is formatted such that it can easily be visualized using ggplot2 (for a trace, similar to Tracer) or phangorn (Schliep 2011) (for the phylogenies in a posterior, similar to DensiTree). Currently, babette does not replace all functionality in BEAUti, as it does 97 not provide 3 out of 7 tree priors, nor does it support RNA alignments or 98 use of morphological data. The many plug-ins of BEAUti are not yet supported by babette. babette does not support all command-line arguments of 100 BEAST2, does not provide the more specialized Tracer analysis options, nor is it 101 as feature-rich in plotting options as DensiTree. Up until now, the babette fea-102

tures implemented are those requested by users. Further extension of babette will be based on future user requests.

105 3 Usage

```
In R, the functions of a package need to be loaded in the global namespace first:
106
    library(babette)
107
   BEAUti, and likewise babette, needs at least a FASTA filename to produce a
108
   BEAST2 configuration file. In BEAUti, this is achieved by loading a FASTA file,
109
    then saving an output file using a common save file dialog. After this, BEAST2
110
   needs to be applied to the created configuration file. It creates multiple files
   storing the posterior. These output files must be parsed by either Tracer of
112
   DensiTree. In babette, all this is achieved by:
    out <- run(fasta_filenames = "anthus_aco.fas")</pre>
114
    This code will create a (temporary) BEAST2 configuration file, from the FASTA
   file with name anthus_aco.fas (which is supplied with the package, from
116
    (Van Els & Norambuena 2018)), using the same default settings as BEAUti,
117
    which are, among others, a Jukes-Cantor site model, a strict clock, and a Yule
118
   birth tree prior. babette will then execute BEAST2 using that file, and parses
119
    the output. The returned data structure, named out, is a list of parameter
120
    estimates (called estimates), posterior phylogenies (called anthus_aco_trees,
121
   named after the alignment's name) and MCMC operator performance (operators).
122
    An example of using a different site model, clock model and tree prior is:
123
    out <- run(
124
      fasta_filenames = "anthus_aco.fas",
125
      site_models = create_hky_site_model(),
126
      clock_models = create_rln_clock_model(),
127
```

```
tree_priors = create_bd_tree_prior()

129

130

This code uses an HKY site model, a relaxed log-normal clock model and a birth-
131 death tree prior, each with their default settings in BEAUti. Table 1 shows an
```

that the arguments' names site_models, clock_models and tree_priors are plural, as each of these can be (a list of) one or more elements. Each of these

overview of all functions to create site models, clock models and tree priors. Note

 $_{135}$ $\,$ arguments must have the same number of elements, so that each alignment has

its own site model, clock model and tree prior. An example of two alignments,

each with its own site model, is:

```
out <- run(
138
      fasta_filenames = c(
139
        "anthus_aco.fas",
140
        "anthus_nd2.fas"
141
      ),
142
      site_models = list(
143
        create_tn93_site_model(),
144
        create_gtr_site_model()
      )
146
   )
147
```

babette also uses the same default prior distributions as BEAUti for each of
the site models, clock models and tree priors. For example, by default, a Yule
tree prior assumes that the birth rate follows a uniform distribution, from minus
infinity to plus infinity. This assumption implies that negative and positive birth
rates are just as likely, where a negative birth rate is biologically impossible (note
that in practice, this usually works out just fine). One may prefer an exponential
distribution instead, as this would assume only positive birth rates, and makes
high birth rates unlikely. To do this in babette:

```
fasta_filenames = "anthus_aco.fas",
157
      tree_priors = create_yule_tree_prior(
158
         birth_rate_distr = create_exp_distr()
159
      )
160
   )
161
   In this same example, one may specify the initial shape parameters of the expo-
   nential distribution. In BEAST2's implementation, an exponential distribution
163
   has one shape parameter: its mean, which can be set to any value with BEAUti.
    Within babette, to set the mean value of the exponential distribution to a fixed
165
    (non-estimated) value, do:
166
    out <- run(
167
      fasta_filenames = "anthus_aco.fas",
168
      tree_priors = create_yule_tree_prior(
         birth_rate_distr = create_exp_distr(
170
           mean = create_mean_param(
171
              value = 1.0,
172
              estimate = FALSE
173
           )
174
         )
175
      )
176
   )
177
   Our initial motivation to create babette was that we wanted to fix the crown
178
   age of a phylogeny. BEAUti assumes that a phylogeny has a crown age that
179
   needs to be jointly estimated with the phylogeny and other parameters. It does
180
   not allow for fixing the crown age. Without babette, one needs to manually edit
181
   the BEAST2 configuration file (Bouckaert & Vaughan 2017), which is tedious
182
   and prone to errors. Fixing the crown ages is especially useful for theoretical
```

out <- run(

156

```
experiments, as this allows for one less source of variation. This is how to specify
   a fixed crown age with babette:
    out <- run(
186
      fasta_filenames = "anthus_aco.fas",
187
      posterior_crown_age = 15
   )
189
   babette allows for the same functionality as Tracer. Tracer works on the values
190
   of the parameter estimates sampled in the BEAST2 run. This is called the
191
    "trace" (hence the name). The start of the trace is usually discarded, as an
192
   MCMC algorithm (such as used by BEAST2) first has to converge to its equi-
193
   librium. The start of the trace, called the "burn-in", will be removed, because
   its parameter estimates are not representative. By default, Tracer discards the
195
   first 10% of all the parameter estimates. To remove a 20% burn-in from all
   parameter estimates in babette, the following code can be used:
197
    traces <- remove_burn_ins(</pre>
198
      traces = out$estimates,
199
      burn_in_fraction = 0.2
200
201
   Tracer shows the ESSes of each posterior's variables. These ESSes are important
202
   to determine the strength of the inference. As a rule of thumb, an ESS of 200 is
    acceptable for any parameter estimate. To calculate the effective sample sizes
204
    (of all estimated variables) in babette:
    esses <- calc_esses(
      traces = traces,
      sample_interval = 1000
   )
```

Tracer displays multiple summary statistics for each estimated variable: the

209

```
mean and its standard error, standard deviation, variance, median, mode, geo-
211
    metric mean, 95% highest posterior density interval, auto-correlation time and
212
    effective sample size. It displays these statistics per variable. In babette, these
213
    summary statistics are collected for all estimated parameters at once:
214
    sum_stats <- calc_summary_stats(</pre>
215
216
       traces = traces,
       sample_interval = 1000
217
    )
218
    babette allows for the same functionality as DensiTree. DensiTree displays the
219
    phylogenies in a posterior at the same time scale, drawn one over one another,
220
    allowing to see the uncertainty in topology and branch lengths. Within the
    object out, the posterior phylogenies are stored as anthus_aco_trees, and can
222
    be plotted as such:
    plot_densitree(phylos = out$anthus_aco_trees)
```

²²⁵ 4 babette resources

babette is free, libre and open source software available from the official R pack-226 age archive at http://cran.r-project.org/src/contrib/PACKAGES.html#babette 227 and is licensed under the GNU General Public License v3.0. babette uses the 228 Travis CI (https://travis-ci.org) continuous integration service, which is 229 known to significantly increase the number of bugs exposed (Vasilescu et al. 2015) and increases the speed at which new features are added (Vasilescu et al. 231 2015). babette has a 100% code coverage, which correlates with code quality (Horgan et al. 1994; Del Frate et al. 1995). babette follows Hadley Wickham's 233 style guide (Wickham 2015), which improves software quality (Fang 2001). babette depends on multiple packages, which are ape (Paradis et al. 2004), 235

```
beautier (Bilderbeek 2018b), beastier (Bilderbeek 2018a), devtools (Wick-
    ham & Chang 2016), geiger (Harmon et al. 2008), ggplot2 (Wickham 2009),
237
    knitr (Xie 2017), phangorn (Schliep 2011), rmarkdown (Allaire et al. 2017),
238
    seqinr (Charif & Lobry 2007), stringr (Wickham 2017), testit (Xie 2014)
239
    and tracerer (Bilderbeek 2018c). We tested babette to give a clean error mes-
240
    sage for incorrect input, by calling babette one million times with random or
241
    random sensible inputs, using the Peregrine high performance computer cluster.
242
    The scripts to do so are supplied with babette.
243
       babette's development takes place on GitHub, https://github.com/richelbilderbeek/
    babette, which accommodates collaboration (Perez-Riverol et al. 2016) and im-
245
    proves transparency (Gorgolewski & Poldrack 2016). babette's GitHub facili-
    tates feature requests and has guidelines how to do so.
247
       babette's documentation is extensive. All functions are documented in the
    package's internal documentation. For quick use, each exported function shows
249
    a minimal example. For easy exploration, each exported function's documen-
    tation links to related functions. Additionally, babette has a vignette that
251
    demonstrates extensively how to use it. There is documentation on the GitHub
252
    to get started, with a dozen examples of BEAUti screenshots with equivalent
253
    babette code. Finally, babette has tutorial videos that can be downloaded or
254
    viewed on YouTube, https://goo.gl/weKaaU.
```

$_{56}$ 5 Citation of babette

```
Scientists using babette in a published paper can cite this article, and/or cite
the babette package directly. To obtain this citation from within an R script,
